

A home that runs on *its own sunshine*

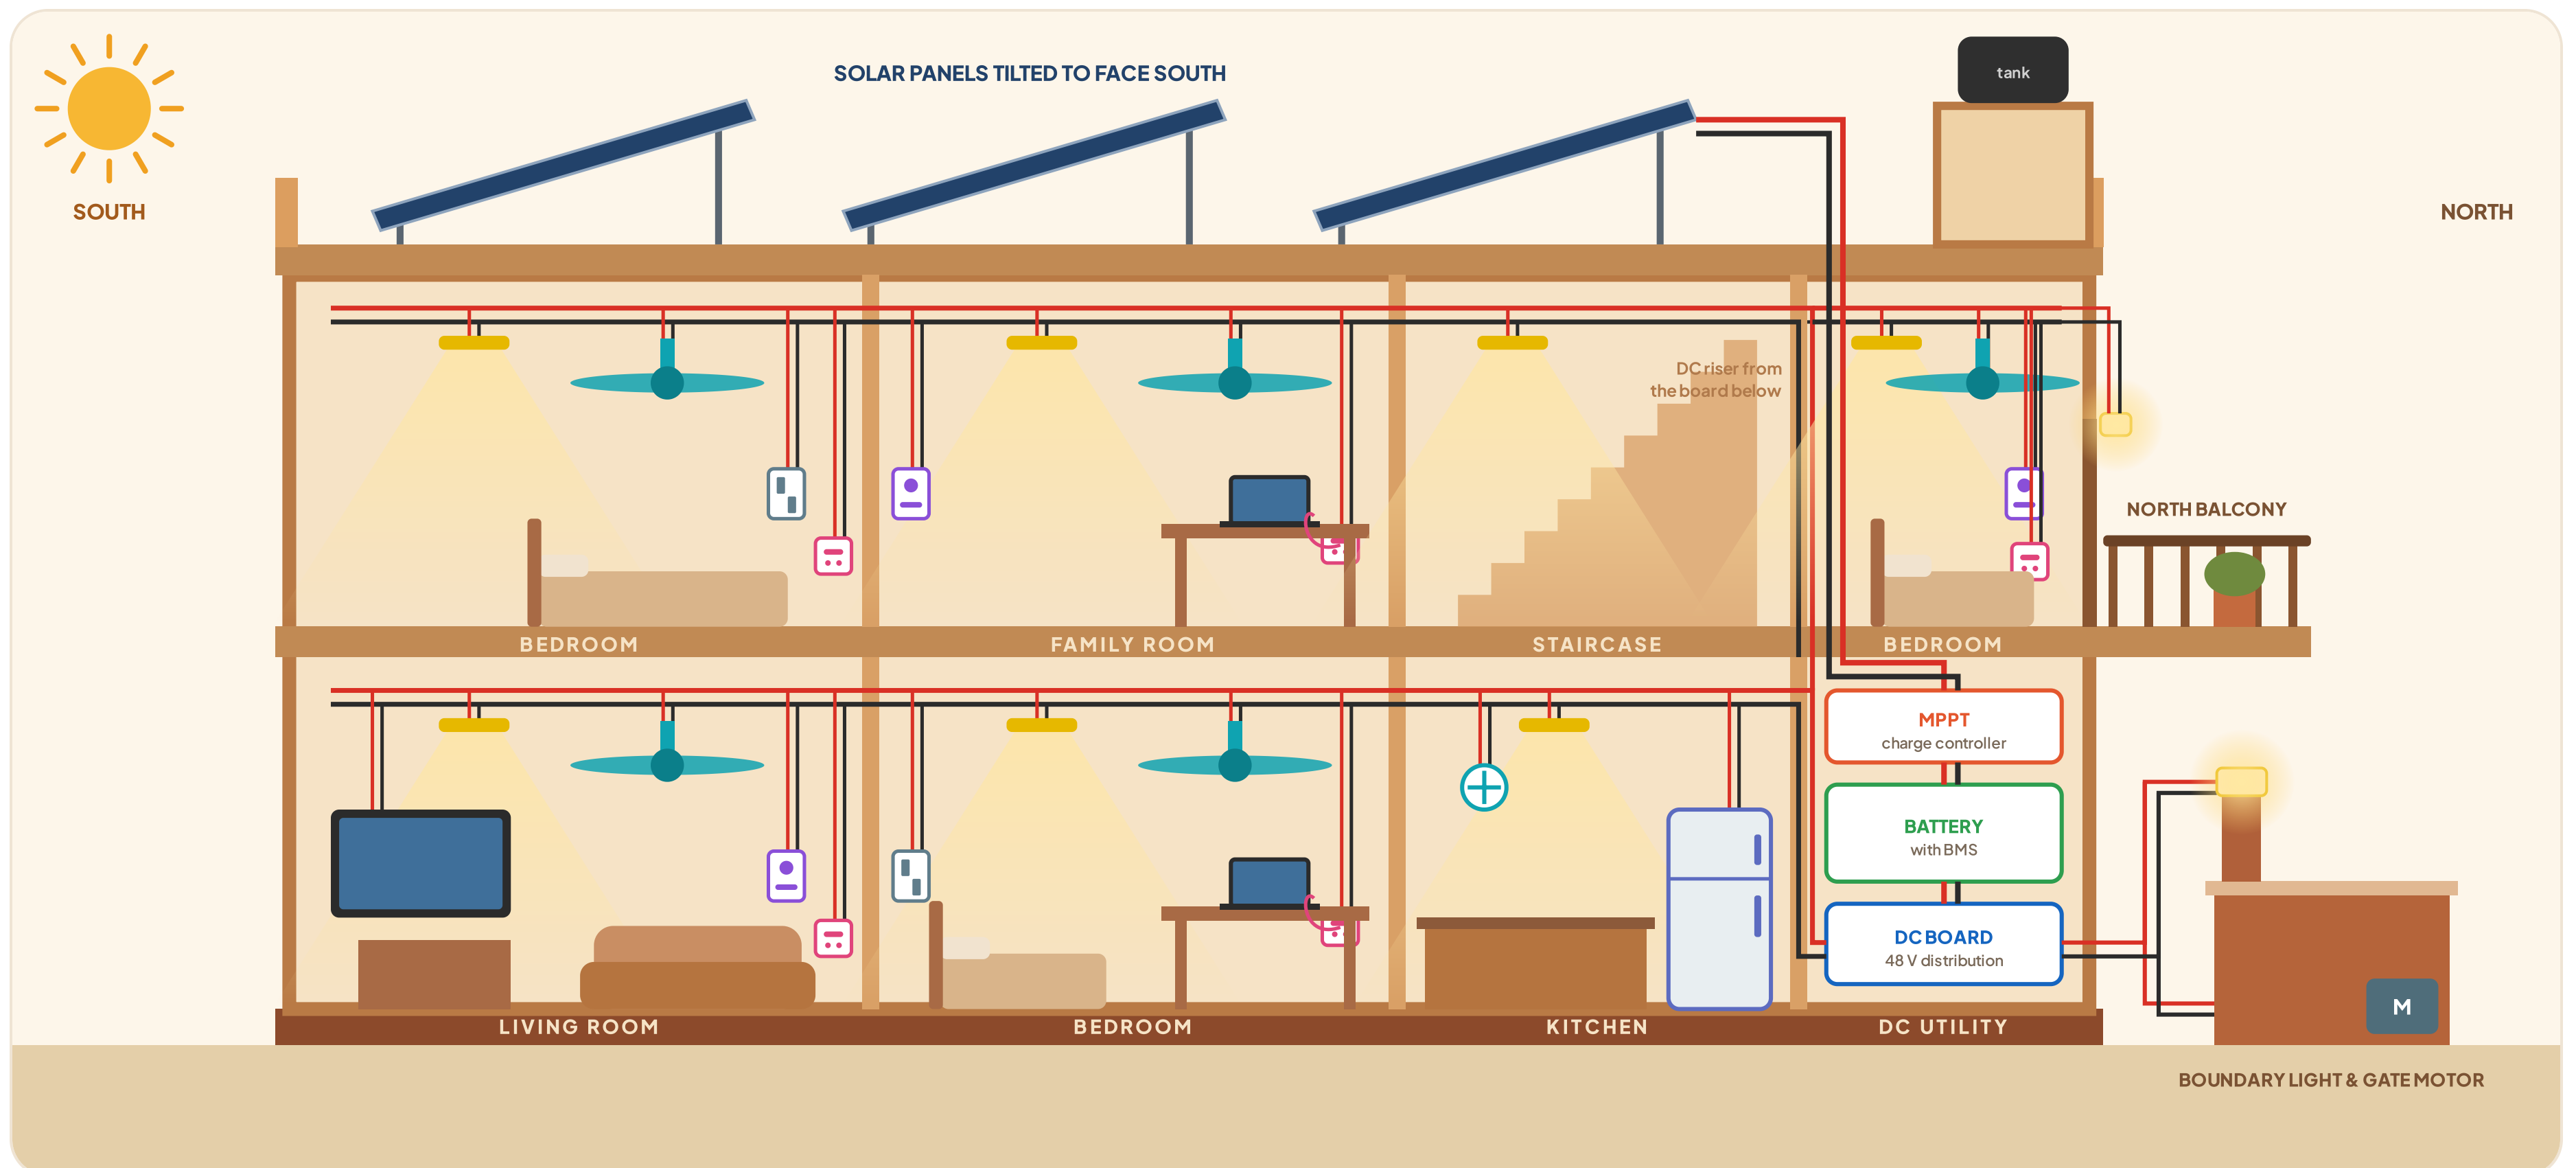

A two-storey home: solar panels face south, the entrance faces east, and every light, fan, socket, the boundary lights and even the gate motor run on safe 48 V DC from the roof and battery.

What you *see*

- 1 Solar panels facing south**
Tilted rows on the terrace catch the sun from morning to evening.
- 2 Stair room & water tank**
The terrace stays usable; panels sit clear of the tank's shadow.
- 3 Entrance on the east**
Morning light at the door; porch with DC light and steps.
- 4 Boundary wall lights**
DC lamps on every pillar light the compound at night.
- 5 Sliding gate**
Slides along the inside of the boundary wall on a rail.
- 6 DC gate motor**
Opens and closes the gate on battery power, even in a power cut.
- 7 Porch light**
Driverless DC LED at the main door.
- 8 DC cable route**
Red (+) and black (–) cables run from the panels to the DC utility room.
- 9 North balcony**
First-floor balcony on the north side, wrapping the north-east corner. Soft, glare-free north light and its own DC wall light.

Inside: *everything runs on DC*

■ Rooftop solar
 ■ MPPT charge controller
 ■ Battery + BMS
 ■ 48 V DC board
 ■ Driverless LED lights
 ■ BLDC fans & exhaust
 ■ Touch panels
 ■ Mechanical switches
 ■ DC & USB-C sockets
 ■ DC fridge
 ■ Gate motor
 ■ Boundary lights
 ■ DC wiring (+ / –)

Want your home or project to run on *solar DC*?
